

Information

CL50010 + CL50020 - Steam and Cleaning Fluid

The steam and cleaning fluid was developed for all popular model railways and model ships.

The fluid is suitable for all smoke generators in locomotives, buildings and model ships. It can also be used for cleaning your locomotives and carriages as it attacks neither the paint, material nor the lettering of your plastic or metal models.

Application:

Smoke generators:

Fill the smoke insert half way with fluid

Cleaning:

Pour some fluid onto a cloth and cloth and use to clean the model

CL50030 + CL50040 - Anti-oxidant Agent (Fluid)

Specially developed to combat oxidation of the brass tracks of your model railway in the open air, our anti-oxidant agent prevents severe oxidation of the track surface in most cases. You should only use the fluid when the train has not been operated for a long period (e.g. more than 4 weeks - or over the winter).

This ensures that the protective film that has developed on the track surface is maintained.

Application:

Apply one drop every 1-2 metres using a pointed object and then allow a locomotive to drive the length of the track in order to spread the fluid. This spreads the fluid over the track surface.

Please note that too much fluid can cause the wheels of the locomotive to spin.

CL50060 - Industrial Glue - Superglue

Ideal for all model-building activities.

Warning: Glue bonds within one second, depending on the type of material!

Safety Instructions:

The following applies to all of the above articles:

Store fluids out of reach of children. The fluids are not suitable for consumption! Avoid contact with the eyes and skin! In the event of accidents, seek medical attention immediately!
