

5 V Voltage Stabiliser CL60000

Dear customer,

This voltage stabiliser has been developed especially for use in LGB® models.

Many customers have long bemoaned the lack of timely and constant operation of the interior and tail lighting on running trains.

The enclosed voltage stabiliser has been developed to eliminate this problem. With only 4 terminals, one LGB® metal wheel set with current collector (LE67403), the appropriate 5 volt lamps and the holders (please ask for the different items and there numbers), your carriages can be adapted for constant 5 volt lighting.

Package contents:

1 p.c. board with installation instructions

Technical data:

Input:
0-24 volt

Output:
5,0 volt

Maximum current:
0,2 ampere

Note:

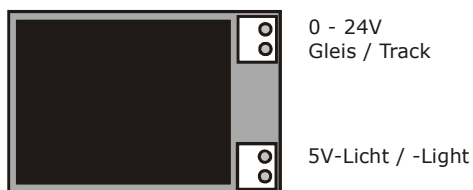

Be sure to read the following description carefully before beginning with the assembly. Please note that a maximum of 2 5-volt bulbs may be connected to the module! **Save the installation instruction.** This product is not for children under 14 years of age. This product has small parts, sharp parts and moving parts.

Installation in analogue operation:

After fitting your carriage with the above-mentioned metal wheels, you can install the voltage stabiliser in the roof or on the side panelling or arch of the carriage, using double-sided adhesive tape.

The connection points for the wires leading from the track to the carriage are screwed onto the screw terminals marked "Track" on the voltage stabiliser.

The connection points for the interior lighting are to be connected to the voltage stabiliser at the screw terminals marked "5V light".

Should you discover a fault despite our careful final inspection please return this article to your dealer with a description of the fault and your receipt, or send the module directly to us. The article is sent back at your own expense!
